SKILLS

- Programming Languages: Python, JavaScript, MYSQL

Web Technologies: HTML, CSS

Development Tools: GitHub, Visual Studio Code (VS Code)

Emerging Technologies: Artificial Intelligence (AI), Machine Learning Algorithms

Productivity Tools: Microsoft Office (MS Office)

EDUCATION

Bachelor of Engineering Computer Science - May 2026.

Visvesvaraya Technological University (VTU), Belgaum, India

Pre-University Course Science – PCMS - June 2022.

Sri Venkataramana PU College, Department of Pre-University, Kundapura, India

Emerging Computer Science Engineering graduate with a strong passion for technology, analytical problem-solving and developing innovative digital solutions, eager to contribute, continuously learn and grow in a collaborative environment that values innovation, excellence and meaningful impact.

EXPERIENCE

AI Intern NeoLotex Business Solutions Pvt Ltd, Bengaluru, India - January 2026 - June 2026

- Utilized TensorFlow and Keras libraries for building deep learning models that enhanced the overall system performance.
- Assisted in developing AI models to enhance business processes and decision-making.
- Assisted in developing machine learning models for data analysis and predictive insights.
- Supported data collection and preprocessing tasks to ensure quality input for AI algorithms.
- Documented processes and findings, ensuring clarity for future reference by team members.
- Developed an AI-powered document classification and data extraction system capable of classifying 5 document types and extracting key information from PDF and image-based documents, automating the document processing workflow using TensorFlow, OCR and Streamlit.

PROJECTS

Smart Document Processing System using AI, AI-based OCR and Deep Learning for Automated Document Recognition

Developed an AI-powered document classification and information extraction system for documents like Aadhaar Card, PAN, invoices, resumes, and salary slips using CNN, OCR, and TensorFlow. Enabled automated processing of image and PDF inputs with accurate document identification and structured data extraction.

Predicting Flash Droughts using Machine Learning & GEE, Satellite-Based Drought Monitoring and Prediction System

Developed a machine learning-based flash drought prediction system using satellite NDVI data processed through the Google Earth Engine API. Trained Logistic Regression and Random Forest models for drought analysis and built a visualization dashboard to provide district-level monitoring and real-time insights.
